THE PEDAGOGICAL READINESS OF INSTRUCTORS TOWARDS ACHIEVING INTEGRATION OF ICTS IN TVET INSTITUTIONS IN KENYA

Abstract: This paper points to the necessity to conduct research on the pedagogical readiness of instructors towards achieving integration of ICT's in Technical and Vocational Education and Training (TVET) institutions in Kenya. Research on the integration of ICTs in teaching and learning in TVET institutions in Kenya have been done to improve the learning process, though very little progress has been recognized towards its effective integration. TVET subsector have revealed that in spite of the many efforts that researchers and educators put over the years in preparing teachers in the educational uses of ICTs, teachers still lack the Pedagogical skills and knowledge needed to be able to teach with ICT technology successfully. The aim of the study was to investigate the Effect of Pedagogical readiness on Effective Integration of ICTs in TVET institution in Kenya with specific reference to Michuki and Thika Technical Training Institute in Murang’a and Kiambu County respectively. The relationship between Effective Integration and Pedagogical readiness is significant, the correlation coefficient, R, is 0.863. Therefore, Effectively Integration is positively correlated with Pedagogical readiness and the relationship is very strong. Teacher's Technical education institutions need to develop strategies and plans to enhance the teaching learning process within teacher education programmes and to assure that all future teachers are well prepared to use the ICTs tools for learning.

Keywords: Pedagogical readiness, Integration of ICTs, TVET, ICTs.

Introduction

Pedagogical readiness as cited by (Bappa-Aliyu, 2012) focuses on the fit between ICTs and current teaching and learning practice. To be pedagogically ready, TVET institution must complete an assessment of the compatibility of ICTs with the current philosophy of learning, an examination of various opportunities for including ICTs in TVET, an assessment of the technological proficiency requirements for teachers and learners, ensuring that ICTs will meet learners’ educational needs, and provision that instructors are competent to facilitate ICT-mediated learning. Therefore, according to Baltušite (2014) the pedagogical readiness is...
particularly significant within the process of the prospective teacher’s professional
development especially in the integration of ICTs in TVET.

(UNESCO, 2002) Argued that for TVET education to reap the full benefits of ICTs in learning, it is essential that pre-service and in-service teachers have basic ICT skills and competencies. Teacher Technical education institutions and programmes must provide the leadership for pre-service and in-service teachers and model the new pedagogies and tools for learning. They must also provide leadership in determining how the new ICT technologies can best be used in the context of the culture, needs, and economic conditions within their country. Teacher Technical education institutions also need to develop strategies and plans to enhance the teaching learning process within teacher education programmes and to assure that all future teachers are well prepared to use the new ICT tools for learning. Bausmith & Barry (2011) Argues that ICT competency generally, would benefit from the insights gleaned from the extensive literature on teacher expertise that focuses on how well teachers understand and use the ICTs in Teaching and learning in TVET.

(Angeli & Valanides, 2009) in their research noted that Agenda on the Pedagogical Integration of ICTs in the field of educational technology TVET, have also shown that in spite of the many efforts that researchers and educators put over the years in preparing teachers in the educational uses of technology, teachers still lack the skills and knowledge needed to be able to teach with technology successfully. Although computing skills are important, skills-based courses are not enough for preparing teachers to teach with ICT technology, because they are usually taught in isolation from a subject-specific context.

Engida (2011) observed that the absence of a subject-specific pedagogical focus in many Technical technology preparation programs, Even in those programs where subject applications are discussed, issues of how ICT in TVET interacts with the content and content-specific pedagogy are not sufficiently explored. As a consequence, the programs fail to adequately prepare teachers in the direction of establishing ICT pedagogical connections between the affordances of technology and the teaching of a particular content domain.

Further Engida (2011) insisted that the lack of national policy for TVET teacher training in the pedagogical integration of ICT and the lack of theory and conceptual frameworks to inform and guide research and actions in the area of teaching with ICT technology. The Lack of incentive plans for teachers and Absence of techno-pedagogical resource banks specific to Kenya education systems which include TVET. Instructors don’t have time to search for and assess the vast quantity of resources available on the Internet. It may therefore be useful to select and compile the most relevant techno pedagogical resources so that teachers can use them easily to improve their teaching (Angeli & Valanides, 2009).

(Hooker, et al., 2011) argued that in Kenya and globally the use of ICT in TVET institutions is for research and accessing information as well as tutoring in computer science and computer literacy. ICT resources are mostly used for developing lecturers’ own knowledge and for teaching students about computers. Facilitation of virtual learning environments or using ICT to develop students’ 21st Century skills is not yet common practice. Lecturers are aware of the potential of ICT to enrich teaching practices but they have neither the skill-sets nor the access to ICT facilities to efficiently integrate the new tools and methodologies in curriculum instruction thus this forms the basis of the study.
Okojie, linzock & Okojie-Boulder (2006) in their conclusion expressed that TVET instructors are encouraged to view ICT integration from a wider perspective and be reflective in their teaching as they use ICT to support and facilitate instruction. ICT integration ought to be considered as part of the process of instructional preparation. Instructional technology should be identified at the planning stage just as the students' readiness is assessed, lesson objectives identified, methods of presenting are established, and evaluation strategies are determined.

**Aim of the Study**

The aim of the study was to investigate the Effect of Pedagogical readiness on Effective Integration of ICTs in TVET institution in Kenya.

**The Research Questions**

The study was guided by the following specific objectives:

1. Does the institution have qualified teachers in all the ICT subjects?
2. What is the teaching staff level of computer usage?
3. Does the Institutional internal ICT training program for ICT users and professionals?
4. Does the institution have adequate ICT technician?

**Research Methodology**

**Research Approaches**

Creswell (2003) noted that if the problem is identifying factors that influence an outcome, the utility of an intervention, or understanding the best predictors of outcomes, then a quantitative approach is best. Quantitative research method is essentially about collecting numerical data to explain a particular phenomenon, particular questions seem immediately suited to being answered using quantitative approach.

**Survey Research Design**

The survey research involves the collection of information from members of a predefined finite population, such as a group of students, teachers or other stakeholders in education, and the analysis of this information to illuminate some important educational issues. The purpose of survey research is to generalize from sample population so that the inferences can be made about some characteristic, attitude or behavior of the population (Creswell, 2003).

The Survey was a cross-sectional in design that are carried out at a just one point in time and popularly used in (Creswell, 2012). According to (Creswell, 2003) they provide with a snapshot of what is happening in that group at that particular time. The researcher opted to use this kind of research in this study considering the desire to acquire vital data from the respondents so as to formulate rational and sound conclusions and recommendations.

**Study Area**

The study was confined to Michuki Technical Training institute in Murang’a County and Thika Technical Training Institute in Kiambu County. Both Technical Training Institute operates under the Education Act as stipulated in the laws of Kenya. The Institute’s operations are also carried out in accordance with the Government policies and procedures as spelt out in official
documents and circulars. The institute are conscious of the Government’s policy of industrialization by the year 2020, and the vision 2030. It is gearing towards playing a significant and leading role in the fulfillment of this policy.

**Target Population**

The study sample was drawn from a population of 195 consisting of Management staff, which include Board of Management and Principal. Administrative staff include Deputy Principal, Head of Departments, Head of Sections and Administration Assistant, teaching staff and technical staff as shown in Table 1 Below.

**Sample Size and Sampling Techniques**

The study adopted the probability sampling which is commonly associated with survey in which individual in the population has an equal probability of being selected with randomization. A representative sample from a population provides ability to generalize to a population (Babbie 1990; Creswell, 2012). Stratified random sampling was used as the most appropriate sampling technique, since the population is not a homogeneous group (Kothari, 2009; Creswell, 2012). The population is divided into 4 sub-population Management staff, Administrative staff, Teaching staff and Technical staff as shown in Table 1 Above.

**Sample Size Determination**

To get sample size from the target population Taro Yamane simplified formula was adopted, it provided a simplified formula to calculate sample size (Yamane, 1967). It’s a random sampling technique formula to estimate sampling size and is used to calculate the sample size (n) given the population size (N) and a margin of error (ε) at 95 percent confidence level (Israel, 2013; Al-Subaihi, 2003). It is computed as

\[ n = \frac{N}{1 + N \varepsilon^2} \]

Michuki TTI sample size

\[ n = \frac{63}{1 + (63 \times 0.05^2)} = 54.43 \text{ Approximate 54 respondents} \]

Thika TTI sample size

\[ n = \frac{126}{1 + (126 \times 0.05^2)} = 95.82 \text{ Approximate 96 respondents} \]

The sample size of 150 respondents was represented as follows; 13 Management staff, 20 Administrative staff, 106 Teaching staff and 11 Technical staff as shown in the Distribution of Population sample Table 2 below.

Research Instruments and Data collection Procedure

The main data collection tool was a structured questionnaire. The structured questionnaire was properly formatted with both open ended and closed questions adopting a five-point Likert scale with a view to uniformed information. A questionnaire is a form used in a survey design that participants in a study complete without intervention of the researchers collecting the data and return to the researcher (Wolf, 2008; Creswell, 2012; Rubin & Babbie, 2008). Observation method was also used by the researcher in the field as an independent evaluation tool to respond to research objectives. The researcher recruited and trained research assistant who helped in questionnaire administration and collection. The Structured questionnaire was distributed at one time by the researcher and Research assistant to the respondents by taking the questionnaire to their respective departments. The Research assistant then collect completed questionnaires from respective departments or offices of the respondents.

Results and Discussion

This section presents the data of the respondents regarding the pedagogical readiness of instructors towards achieving Effective integration of ICTs in in selected TVET institution in Kiambu and Murang’a County, Kenya

The institution has qualified teachers in all the ICT subjects

The study sought to find out whether the institution has qualified teachers in all the ICT subjects in selected TVET institution in Kiambu and Murang’a County, Kenya
From the findings of figure 1 revealed that 91.2% of the respondent felt that the institution has qualified teachers in all the ICT subjects offered in the institutions. This may be attributed by the in-service training programs on ICT in the institution as stipulated in the Institution strategic plan and also recruitment of ICT specific graduates in the institution as teachers and Technician. (UNESCO, 2002) in support noted that for education to reap the full benefits of ICTs in learning, it is essential that pre-service and in-service teachers have basic ICT skills and competencies.

From the findings can also be inferred that Teacher Service Commission and Board Of Management of the TVET institutions in Kenya recruit ICT competent Teachers and have carried out valuation of the technological proficiency requirements for teachers, ensuring that ICTs will meet learners’ educational needs, and provision that teachers are competent to facilitate ICT-mediated learning as supported by (Bappa-Allyu, 2012).

**The teaching staff level of computer usage**

The study sought to find out the teaching staff level of computer usage in selected TVET institution in Kiambu and Murang’a County, Kenya

**Table 3: The teaching staff level of computer usage**

Source: Author Data (2015)

The results from table 3 revealed that teaching staff having High level of computer usage was supported by over 60% of the respondent. This can be inferred that teachers have endeavored to be ICT competent this can be through in-service program catered for by the ICT strategic
plan, teachers own initiative or have acquired competency from their previous Teacher Training education institutions or universities.

The results were in agreement with (Angeli & Valanides, 2009) which have shown that in spite of the many efforts that researchers and educators put over the years in preparing teachers in the educational uses of technology, teachers still lack the skills and knowledge needed to be able to teach with technology successfully. These researchers and their reviews have attributed the failure to adequately prepare teachers to teach with ICT in TVET this can be observed in the findings that 27% of the teachers have low ICT competency.

It was also observed that Majority of teachers acquired basic computer operation and use of computers for word processing, spread sheet, presentation and institutional Management Information System. On use of Internet and online communications, many teachers knew how to use web browsing, email, social networks and instant messaging tools. When it comes to the use of ICT to enhance the quality of teaching and learning process, however, most teachers fell short on this as supported by (Paryono & Quito, 2010).

Institutional internal ICT training program for ICT users and professionals
The study sought to find out the organization has internal ICT training program for ICT users and professionals in selected TVET institution in Kiambu and Murang’a County, Kenya.

From the findings from figure 2 we can deduce that 75.1% of the respondents indicated that the institutions has internal ICT training program for ICT users and staff members as it has been anchored in the ICT strategic plan. The findings were in agreement with [4] that The Lack of incentive plans for teachers and Absence of techno-pedagogical resource banks specific to the TVET systems hinderance the integration of ITCs in TVET.

The institution has adequate ICT technician
The study sought to find out the organization has internal ICT training program for ICT users and professionals in selected TVET institution in Kiambu and Murang’a County, Kenya.
Table 4: Adequate ICT technician

</tbody>
</table>

Source: Author Data (2015)

The findings established the institutions have adequate ICT technicians as indicated by 60.2% of the respondents. The ICT technician act as support person for all ICTs enquiry in the institutions especially in the laboratories and management systems. The ICT department and ICT Technician maintain the ICT infrastructure and support the users in the institution thus are critical support in integration of ICT in their respective (Hooker, et al., 2011).

The relationship between Pedagogical readiness and Integration of ICTs in TVET institution in Kenya

The study sought to establish the relationship between Pedagogical readiness and Integration of ICTs by using simple regression.

Table 5: Model Summary for Pedagogical Readiness

a. Predictors: (Constant), Pedagogical readiness

Source: Author Data (2015)

This table 5 provides the R and R² value. The R value is 0.863, which represents the simple correlation. It indicates a high degree of correlation. The R² value indicates how much of the dependent variable Effective Integration can be explained by the independent variable, Pedagogical readiness. In this case, 74.4% can be explained, which is very large.

Table 6: ANOVA Table for Pedagogical Readiness

</tbody>
</table>

a. Dependent Variable: Effectively Integration
b. Predictors: (Constant), Pedagogical readiness

Source: Author Data (2015)

The ANOVA table 6 above indicates that the regression model predicts the outcome variable significantly well. This indicates the statistical significance of the regression model that was
applied since \( p < 0.00 \), which is less than 0.05, and indicates that, overall, the model applied can statistically significantly predict the outcome variable.

**Table 7: Coefficients for Pedagogical Readiness**

<table>
<thead>

</tr>
<tr>
<td>Pedagogical readiness</td>
<td>.892</td>
<td>.050</td>
<td>17.964</td>
<td>.000</td>
</tr>
</tbody>
</table>

a. Dependent Variable: Effectively Integration

Source: Author Data (2015)

The table 7 above, Coefficients, provides us with information on each predictor variable. This gives us the information we need to predict Effectively Integration from Pedagogical readiness. The constant and Effectively Integration contribute significantly to the model thus can present the regression equation as:

\[
\text{Effectively Integration} = 0.892 + 0.190(\text{Pedagogical readiness})
\]

From ANOVA Table 6 and Coefficients Table 7, since the p-value is 0, the relationship between Effective Integration and Pedagogical readiness is significant. From Table 5 the correlation coefficient, \( R \), is 0.863. Therefore, we can conclude that Effective Integration is positively correlated with Pedagogical readiness and the relationship is very strong.

**Summary of findings**

In summary the study findings revealed that that the institution have qualified teachers in all the ICT subjects offered in the institutions, that teaching staff have High level of computer usage and that the institutions have adequate ICT technicians. The institutions have internal ICT training program for ICT users and staff members as it has been anchored in the ICT strategic plan. The relationship between Effective Integration and Pedagogical readiness is significant, the correlation coefficient, \( R \), is 0.863. Therefore, the findings revealed that Effective Integration is positively correlated with ICT Policy and the relationship is very strong.

**Conclusion**

Effective Integration is positively correlated with Pedagogical readiness and the relationship is very strong. On Competency the TSC and Board of Management of TVET institutions in Kenya recruit ICT competent Teachers and though they have not carried out an assessment of the technological proficiency requirements for teachers, and provision that teachers are competent to facilitate ICT Integration in TVET.

**Recommendations**

Teacher’s Technical education institutions need to develop strategies and plans to enhance the teaching learning process within teacher education programmes and to assure that all future teachers are well prepared to use the ICTs tools for learning. The TVET institution
should enhance ICT Competency to staff through Internal and external programs on formal ICT competency such as Seminar, workshops and conference and anchored it in ICT policy.
